Graphs

Kuhn's algorithm for bipartite matching

```
The graph is split into 2 halves of n1 and n2 vertices.
    Complexity: O(n1 * m). Usually runs much faster. MUCH

→ FASTER!!!

    const int N = 305;
5
    vector<int> g[N]; // Stores edges from left half to right.
    bool used[N]; // Stores if vertex from left half is used.
    int mt[N]; // For every vertex in right half, stores to which
     \hookrightarrow vertex in left half it's matched (-1 if not matched).
    bool try_dfs(int v){
11
      if (used[v]) return false;
      used[v] = 1;
13
      for (auto u : g[v]){
        15
          mt[u] = v;
16
17
          return true;
18
19
      return false:
20
    }
21
22
    int main(){
23
24
      for (int i = 1; i <= n2; i++) mt[i] = -1;
25
      for (int i = 1; i <= n1; i++) used[i] = 0;</pre>
      for (int i = 1; i <= n1; i++){
27
28
        if (try_dfs(i)){
          for (int j = 1; j <= n1; j++) used[j] = 0;
29
        }
30
      }
      vector<pair<int, int>> ans;
32
      for (int i = 1; i <= n2; i++){
33
        if (mt[i] != -1) ans.pb({mt[i], i});
34
35
    }
36
37
    // Finding maximal independent set: size = # of nodes - # of

    ⇔ edges in matching.

    // To construct: launch Kuhn-like DFS from unmatched nodes in
     \hookrightarrow the left half.
    // Independent set = visited nodes in left half + unvisited in
        right half.
    // Finding minimal vertex cover: complement of maximal
```

Hungarian algorithm for Assignment Problem

 \hookrightarrow independent set.

• Given a 1-indexed $(n \times m)$ matrix A, select a number in each row such that each column has at most 1 number selected, and the sum of the selected numbers is minimized.

```
int INF = 1e9; // constant greater than any number in the
     \hookrightarrow matrix
    vector < int > u(n+1), v(m+1), p(m+1), way(m+1);
    for (int i=1; i<=n; ++i) {
        p[0] = i;
         int j0 = 0;
         vector<int> minv (m+1, INF);
         vector<bool> used (m+1, false);
         do {
             used[j0] = true;
             int i0 = p[j0], delta = INF, j1;
10
             for (int j=1; j<=m; ++j)
11
                 if (!used[j]) {
12
                      int cur = A[i0][j]-u[i0]-v[j];
13
                      if (cur < minv[j])</pre>
```

```
minv[j] = cur, way[j] = j0;
15
16
                     if (minv[j] < delta)</pre>
17
                         delta = minv[j], j1 = j;
                 }

    return st.query(1, r - 1);
  }
};
```

Aho Corasick Trie

• For each node in the trie, the suffix link points to the longest proper suffix of the represented string. The terminal-link tree has square-root height (can be constructed by DFS).

```
const int S = 26;
    // Function converting char to int.
    int ctoi(char c){
      return c - 'a';
5
    // To add terminal links, use DFS
    struct Node{
      vector<int> nxt;
10
       int link;
11
12
       bool terminal:
13
       Node() {
14
        nxt.assign(S, -1), link = 0, terminal = 0;
15
16
    };
17
18
    vector<Node> trie(1):
19
20
    // add\_string\ returns\ the\ terminal\ vertex.
21
    int add_string(string& s){
```

34
35
36
    Suffix links are compressed.
37
     This means that:
38
39
       If vertex v has a child by letter x, then:
         trie[v].nxt[x] points to that child.
40
       If vertex v doesn't have such child, then:
41
         trie[v].nxt[x] points to the suffix link of that child
42
         if we would actually have it.
43
44

      return trie[v].nxt[ctoi(c)];
74
```

Convex Hull Trick

- Allows to insert a linear function to the hull in (1) and get the minimum/maximum value of the stored function at a point in $O(\log n)$.
- NOTE: The lines must be added in the order of decreasing/increasing gradients. CAREFULLY CHECK THE SETUP BEFORE USING!
- IMPORTANT: THE DEFAULT VERSION SURELY WORKS. IF MODIFIED VERSIONS DON'T WORK, TRY TRANSFORMING THEM TO THE DEFAULT ONE BY CHANGING SIGNS.

```
struct line{
     11 k. b:
      11 f(11 x){
        return k * x + b:
      };
5
   };
6
```

```
vector<line> hull;
8
10
    void add_line(line nl){
      if (!hull.empty() && hull.back().k == nl.k){
11
        nl.b = min(nl.b, hull.back().b); // Default: minimum. For
       maximum change "min" to "max".
        hull.pop_back();
13
      }
14
      while (sz(hull) > 1){
15
         auto& 11 = hull.end()[-2], 12 = hull.back();
         if ((nl.b - l1.b) * (l2.k - nl.k) >= (nl.b - l2.b) * (l1.k)
17
        - nl.k)) hull.pop_back(); // Default: decreasing gradient
        k. For increasing k change the sign to <=.
         else break;
19
      hull.pb(nl):
20
21
    }
    11 get(11 x){
23
      int 1 = 0, r = sz(hull);
24
      while (r - 1 > 1){
25
        int mid = (1 + r) / 2;
         if (hull[mid - 1].f(x) >= hull[mid].f(x)) 1 = mid; //
       Default: minimum. For maximum change the sign to <=.
28
         else r = mid;
29
      return hull[1].f(x);
30
31
```

Li-Chao Segment Tree

- $\bullet\,$ allows to add linear functions in any order and query minimum/maximum value of those at a point, all in O(log n).

Ordered Set

35

Measuring Execution Time

```
1  ld tic = clock();
2  // execute algo...
3  ld tac = clock();
4  // Time in milliseconds
5  cerr << (tac - tic) / CLOCKS_PER_SEC * 1000 << endl;
6  // No need to comment out the print because it's done to cerr.</pre>
```

Setting Fixed D.P. Precision

```
cout << setprecision(d) << fixed;

// Each number is rounded to d digits after the decimal point,

and truncated.
```

Common Bugs and General Advice

- Check overflow, array bounds
- Check variable overloading
- Check special cases (n=1?)
- Do something instead of nothing, stay organized
- Write stuff down!
- Don't get stuck on one approach!
