Berlekamp-Massey

• Recovers any n-order linear recurrence relation from the first 2n terms of the sequence.

- \bullet Input s is the sequence to be analyzed.
- Output c is the shortest sequence $c_1, ..., c_n$, such that

$$s_m = \sum_{i=1}^n c_i \cdot s_{m-i}, \text{ for all } m \ge n.$$

- Be careful since c is returned in 0-based indexation.
- Complexity: $O(N^2)$

```
vector<11> berlekamp massey(vector<11> s) {
 int n = sz(s), l = 0, m = 1:
 vector<ll> b(n), c(n);
 11 \ 1dd = b[0] = c[0] = 1;
 for (int i = 0; i < n; i++, m++) {
   11 d = s[i];
   for (int j = 1; j \le 1; j ++) d = (d + c[j] * s[i -

→ il) % MOD:

   if (d == 0) continue;
   vector<11> temp = c;
   11 coef = d * power(ldd, MOD - 2) % MOD;
   for (int j = m; j < n; j++){
     c[j] = (c[j] + MOD - coef * b[j - m]) % MOD;
     if (c[j] < 0) c[j] += MOD;
   if (2 * 1 <= i) {
     1 = i + 1 - 1;
     b = temp:
     1dd = d:
 c.resize(1 + 1):
 c.erase(c.begin());
 for (11 &x : c)
     x = (MOD - x) \% MOD;
 return c;
```

Calculating k-th term of a linear recurrence

• Given the first n terms $s_0, s_1, ..., s_{n-1}$ and the sequence $c_1, c_2, ..., c_n$ such that

$$s_m = \sum_{i=1}^n c_i \cdot s_{m-i}$$
, for all $m \ge n$,

the function calc_kth computes s_k .

• Complexity: $O(n^2 \log k)$

```
vector<11> poly mult mod(vector<11> p, vector<11> q,

  vector<11>& c){
      vector<11> ans(sz(p) + sz(q) - 1):

Aho Corasick Trie
   • For each node in the trie, the suffix link points to
      the longest proper suffix of the represented string.
      The terminal-link tree has square-root height (can
     be constructed by DFS).
                                                       58
const int S = 26;
                                                       60
// Function converting char to int.
                                                       61
int ctoi(char c){
                                                       62
 return c - 'a';
                                                       63
// To add terminal links, use DFS
struct Node{
 vector<int> nxt:
```

```
int link;
  bool terminal;
  Node() {
   nxt.assign(S, -1), link = 0, terminal = 0;
};
vector<Node> trie(1);
// add string returns the terminal vertex.
int add_string(string& s){
 int v = 0:
  for (auto c : s){
    int cur = ctoi(c);
   if (trie[v].nxt[cur] == -1){
      trie[v].nxt[cur] = sz(trie);
      trie.emplace back();
    v = trie[v].nxt[cur];
  trie[v].terminal = 1;
  return v;
Suffix links are compressed.
This means that:
 If vertex v has a child by letter x, then:
    trie[v].nxt[x] points to that child.
  If vertex v doesn't have such child, then:
    trie[v].nxt[x] points to the suffix link of that
    if we would actually have it.
void add links(){
  queue<int> q;
  q.push(0);
  while (!q.empty()){
   auto v = q.front();
   int u = trie[v].link;
    q.pop();
    for (int i = 0: i < S: i++){
      int& ch = trie[v].nxt[i];
      if (ch == -1){
        ch = v? trie[u].nxt[i] : 0;
        trie[ch].link = v? trie[u].nxt[i] : 0;
        q.push(ch);
bool is_terminal(int v){
 return trie[v].terminal;
```

Convex Hull Trick

- Allows to insert a linear function to the hull in (1) and get the minimum/maximum value of the stored function at a point in O(log n).
- NOTE: The lines must be added in the order of decreasing/increasing gradients. CAREFULLY CHECK THE SETUP BEFORE USING!
- IMPORTANT: THE DEFAULT VERSION SURELY WORKS. IF MODIFIED VERSIONS DON'T WORK, TRY TRANSFORMING THEM TO THE DEFAULT ONE BY CHANGING SIGNS.

```
12

\rightarrow m? get(2 * v + 1, 1, m, x) : get(2 * v + 2, m, r,
\leftrightarrow x));
   }
 }
 void add line(ll k. ll b){
   add line(0, 0, n, line(k, b));
 11 get(11 x){
   return get(0, 0, n, on_points? lower_bound(all(pts),

    x) - pts.begin() : x);
}; // Always pass the actual value of x, even if LCT
⇒ is on points.
```

Persistent Segment Tree

• for RSQ

```
struct Node {
    ll val;
    Node *l, *r;

    Node(ll x) : val(x), l(nullptr), r(nullptr) {}
    Node(Node *ll, Node *rr) {
        l = ll, r = rr;
        val = 0;
        if (l) val += l->val;
        if (r) val += r->val;
}
```

```
Node(Node *cp) : val(cp->val), 1(cp->1), r(cp->r) {}
    };
13
     const int N = 2e5 + 20:
    ll a[N];
    Node *roots[N];
    int n, cnt = 1;
    Node *build(int l = 1, int r = n) {
         if (1 == r) return new Node(a[1]);
19
         int mid = (1 + r) / 2;
         return new Node(build(1, mid), build(mid + 1, r));
21
22
    Node *update(Node *node, int val, int pos, int l = 1,
     \rightarrow int r = n) {
         if (1 == r) return new Node(val);
         int mid = (1 + r) / 2;
         if (pos > mid)
             return new Node(node->1, update(node->r, val,
     \rightarrow pos, mid + 1, r));
         else return new Node(update(node->1, val, pos, 1,
        mid), node->r);
    ll query(Node *node, int a, int b, int l = 1, int r = n)
         if (1 > b \mid \mid r < a) return 0;
         if (1 \ge a \&\& r \le b) return node->val;
         int mid = (1 + r) / 2;
         return query(node->1, a, b, 1, mid) + query(node->r,
     \rightarrow a, b, mid + 1, r);
    }
```

Miscellaneous

Ordered Set

```
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;
typedef tree<int, null_type, less<int>, rb_tree_tag,
tree_order_statistics_node_update> ordered_set;
```

Measuring Execution Time

Setting Fixed D.P. Precision

```
cout << setprecision(d) << fixed;
// Each number is rounded to d digits after the decimal
point, and truncated.</pre>
```

Common Bugs and General Advice

- Check overflow, array bounds
- Check variable overloading
- Check special cases (n=1?)
- Do something instead of nothing, stay organized
- Write stuff down!
- Don't get stuck on one approach!
