### Finding Bridges

```
Results are stored in a map "is_bridge".
    For each connected component, call "dfs(starting vertex,

→ starting vertex)".

    const int N = 2e5 + 10; // Careful with the constant!
    vector<int> g[N];
8
9
    int tin[N], fup[N], timer;
    map<pair<int, int>, bool> is_bridge;
10
    void dfs(int v, int p){
12
13
      tin[v] = ++timer;
      fup[v] = tin[v];
14
      for (auto u : g[v]){
15
        if (!tin[u]){
          dfs(u, v);
17
           if (fup[u] > tin[v]){
18
            is_bridge[{u, v}] = is_bridge[{v, u}] = true;
19
20
           fup[v] = min(fup[v], fup[u]);
21
22
23
          if (u != p) fup[v] = min(fup[v], tin[u]);
24
25
26
      }
    }
```

#### Virtual Tree

```
// order stores the nodes in the queried set
    sort(all(order), [&] (int u, int v){return tin[u] < tin[v];});</pre>
    int m = sz(order);
    for (int i = 1; i < m; i++){
         order.pb(lca(order[i], order[i - 1]));
6
    sort(all(order), [&] (int u, int v){return tin[u] < tin[v];});</pre>
    order.erase(unique(all(order)), order.end());
    vector<int> stk{order[0]}:
    for (int i = 1; i < sz(order); i++){</pre>
11
         int v = order[i];
         while (tout[stk.back()] < tout[v]) stk.pop_back();</pre>
12
         int u = stk.back();
13
         vg[u].pb({v, dep[v] - dep[u]});
14
         stk.pb(v);
15
    }
16
```

## **HLD on Edges DFS**

```

# MIT's FFT/NTT, Polynomial mod/log/exp Template

- For integers rounding works if  $(|a| + |b|) \max(a, b) < \sim 10^9$ , or in theory maybe  $10^6$
- $\frac{1}{P(x)}$  in  $O(n \log n)$ ,  $e^{P(x)}$  in  $O(n \log n)$ ,  $\ln(P(x))$  in  $O(n \log n)$ ,  $P(x)^k$  in  $O(n \log n)$ , Evaluates  $P(x_1), \cdots, P(x_n)$  in  $O(n \log^2 n)$ , Lagrange Interpolation in  $O(n \log^2 n)$

```
// use #define FFT 1 to use FFT instead of NTT (default)
    // Examples:
    // poly a(n+1); // constructs degree n poly
    //a[0].v = 10; // assigns constant term a_0 = 10
    // poly b = exp(a);
    // poly is vector<num>
    // for NTT, num stores just one int named v
    // for FFT, num stores two doubles named x (real), y (imag)

75
         1 = c[1] - 1, r = c[r] - 1;
76
77
         if (1 > r) swap(1, r);
78
         return st.query(1, r - 1);
79
    };
80
```

#### Aho Corasick Trie

• For each node in the trie, the suffix link points to the longest proper suffix of the represented string. The terminal-link tree has square-root height (can be constructed by DFS).

```
const int S = 26;
    // Function converting char to int.
    int ctoi(char c){
      return c - 'a';
5
    // To add terminal links, use DFS
    struct Nodes
9
10
      vector<int> nxt;
      int link;
11
      bool terminal:
12
13
      Node() {
14
        nxt.assign(S, -1), link = 0, terminal = 0;
15
16
    };
17
    vector<Node> trie(1);
19
20
    // add_string returns the terminal vertex.
21
    int add_string(string& s){
22
      int v = 0;
23
      for (auto c : s){
24
         int cur = ctoi(c);
        if (trie[v].nxt[cur] == -1){
26
           trie[v].nxt[cur] = sz(trie);
28
           trie.emplace_back();
29
           = trie[v].nxt[cur];
30
31
      trie[v].terminal = 1;
32
33
      return v;
34
35
36
37
    Suffix links are compressed.
    This means that:
38
      If vertex v has a child by letter x, then:
39
        trie[v].nxt[x] points to that child.
40
      If vertex v doesn't have such child, then:
```

```
trie[v].nxt[x] points to the suffix link of that child
    if we would actually have it.
void add_links(){
  queue<int> q;
  q.push(0);
  while (!q.empty()){
    auto v = q.front();
    int u = trie[v].link;
    q.pop();
    for (int i = 0; i < S; i++){
      int& ch = trie[v].nxt[i];
      if (ch == -1){
        ch = v? trie[u].nxt[i] : 0;
      }
      else{
        trie[ch].link = v? trie[u].nxt[i] : 0;
        q.push(ch);
    }
  }
}
bool is_terminal(int v){
  return trie[v].terminal;
int get link(int v){
  return trie[v].link;
int go(int v, char c){
 return trie[v].nxt[ctoi(c)];
```

- Allows to insert a linear function to the hull in (1) and get the minimum/maximum value of the stored function at a point in O(log n).
- NOTE: The lines must be added in the order of decreasing/increasing gradients. CAREFULLY CHECK THE SETUP BEFORE USING!
- IMPORTANT: THE DEFAULT VERSION SURELY WORKS. IF MODIFIED VERSIONS DON'T WORK, TRY TRANSFORMING THEM TO THE DEFAULT ONE BY CHANGING SIGNS.

```
struct line{
2
      ll k, b;
      11 f(11 x){
        return k * x + b:
4
5
    };
6

    Default: minimum. For maximum change the sign to <=.
    else r = mid;
}
return hull[l].f(x);
}</pre>
```

## Li-Chao Segment Tree

- allows to add linear functions in any order and query minimum/maximum value of those at a point, all in O(log n).
- Clear: clear()

```
const 11 INF = 1e18; // Change the constant!
    struct LiChaoTree{

    };
13
    const int N = 2e5 + 20;
14
    ll a[N];
15
    Node *roots[N];
16
    int n, cnt = 1;
17
    Node *build(int 1 = 1, int r = n) {
18
         if (l == r) return new Node(a[l]);
         int mid = (1 + r) / 2;
20
         return new Node(build(1, mid), build(mid + 1, r));
21
    }
22
    Node *update(Node *node, int val, int pos, int l = 1, int r =
23
     \hookrightarrow n) {
         if (1 == r) return new Node(val);
         int mid = (1 + r) / 2;
26
         if (pos > mid)
             return new Node(node->1, update(node->r, val, pos, mid
27
        + 1, r));
         else return new Node(update(node->1, val, pos, 1, mid),
28
    }
29
30
    11 query(Node *node, int a, int b, int l = 1, int r = n) {
         if (1 > b \mid \mid r < a) return 0;
31
         if (1 \ge a \&\& r \le b) return node->val;
32
         int mid = (1 + r) / 2;
         return query(node->1, a, b, 1, mid) + query(node->r, a, b,
34
        mid + 1, r);
    }
```

#### Miscellaneous

#### Ordered Set

```
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;
typedef tree<int, null_type, less<int>, rb_tree_tag,
tree_order_statistics_node_update> ordered_set;
```

## Measuring Execution Time

```
1  ld tic = clock();
2  // execute algo...
3  ld tac = clock();
4  // Time in milliseconds
5  cerr << (tac - tic) / CLOCKS_PER_SEC * 1000 << endl;
6  // No need to comment out the print because it's done to cerr.</pre>
```

## Setting Fixed D.P. Precision

```
cout << setprecision(d) << fixed;
// Each number is rounded to d digits after the decimal point,
and truncated.</pre>
```

## Common Bugs and General Advice

- Check overflow, array bounds
- Check variable overloading
- Check special cases (n=1?)
- Do something instead of nothing, stay organized
- Write stuff down!
- Don't get stuck on one approach!
